We designed Circle to be compatible with as many routers and network extenders as possible. In doing so, we specifically tested many routers and extenders on the market today, but we have not tested every one. The chart below shows our current test results. You can use the information below to see if your router is listed.

If you're running into problems, check the list below for your router to see if we've noted any known issues.

# Extenders, Mobile Hotspots, and Satellite Connections

Mobile hotspots and satellite connections tend to be incompatible with Circle and we do not guarantee that Circle will work to manage these types of networks.

In addition, Circle does not recommend pairing your Circle unit with an extender. You can use extenders with Circle, but we do not recommend setting up Circle solely on a network provided by your extender.

A Zyxel C3000Z (Requires Ethernet connection; Learn more)

## **Extenders and Circle**

We designed Circle to work with most extenders on the market when properly configured. Circle should be paired with your main 2.4ghz network, and not with the network created by your extender.
